INTELLIGENT MEDRECORDS

✓ **Provides consistent document type classification**

✓ **Manages high volumes of diverse formats**

✓ **Improves accuracy and speed**

Are medical records piling up faster than your staff can address them for ongoing clinician care decisions? Medical records from a variety of sources and in a variety of formats, as well as the push to meet clinician deadlines, can create opportunities for errors and time drains that cost your organization precious time and money.
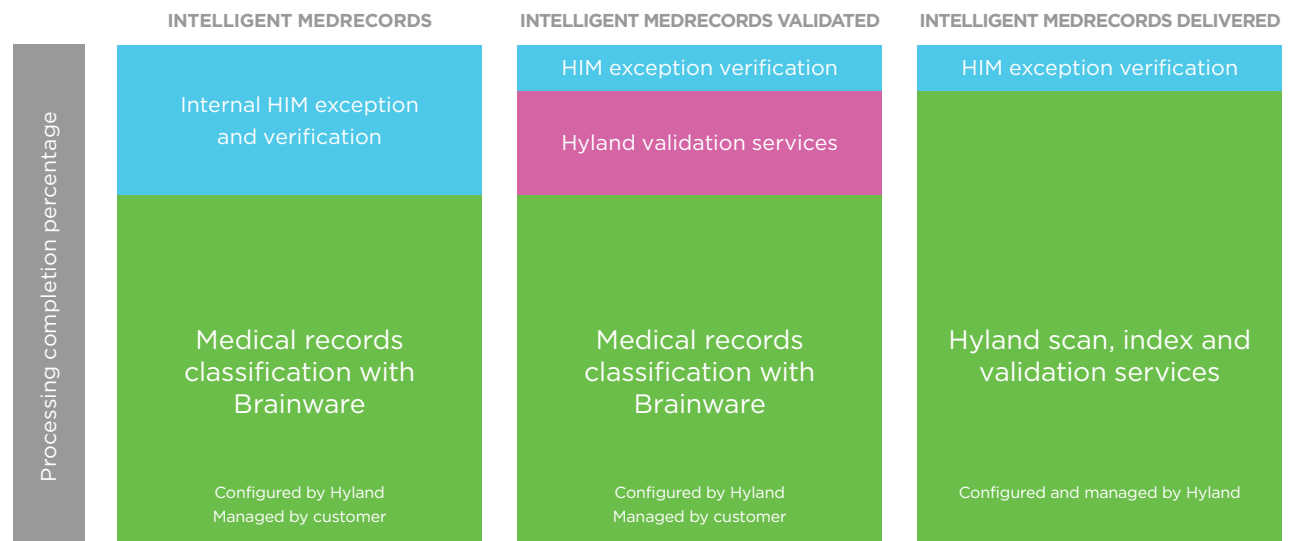

How can your health system better manage and automate medical records classification by leveraging your OnBase enterprise information platform to save staff time and reduce cost?

Brainware, Hyland's intelligent capture, extraction and validation platform, automatically sorts both paper and digital documentation and drives the classified data into OnBase and your electronic medical record (EMR). With this intelligent solution, capture and indexing tasks become automated and simplified, improving patient data accuracy and consistency. This enables your healthcare organization to more efficiently process the entire patient record, regardless of file type or format, within your EMR or enterprise content management (ECM) platform within 24 hours.

CUSTOMIZED SOLUTIONS

Hyland can customize our approach based on your preferences, with you owning as much or as little of the data capture process as your organization sees fit.

Hyland®

Ensure accurate information routes to your EMR quickly while freeing your HIM staff for higher-value work with Intelligent MedRecords.

OPTION 1: INTELLIGENT MEDRECORDS

A software-based solution to automate medical records classification.

You uphold the solution in-house and have full ownership of the Brainware intelligent capture technology that can be leveraged across your enterprise. This option provides your organization with the flexibility to implement additional solutions that are built on the Brainware technology. Your staff is accountable for scanning any paper documents, and reviewing and verifying any exceptions that are not classified by Brainware.

OPTION 2: INTELLIGENT MEDRECORDS VALIDATED

The full power of medical records classification with Brainware technology, plus the addition of human ingenuity to enable verification services for anything that is not classified by Brainware.

While the software learns your data/workflows and continues to improve upon accuracy, this solution incorporates an outsourced exception management service that ensures all data is checked for accuracy and quality.

OPTION 3: INTELLIGENT MEDRECORDS DELIVERED

A fully outsourced medical records classification model that doesn't require a local technology deployment but still enables your organization to drive classification of patient medical records into the system of your choice.

We will handle the logistics, including scanning, indexing accuracy and staffing, and absorb the volume ebbs and flows so your staff is free to focus on other priorities.
