DOCUMENT FILTERS | CUSTOMER SUCCESS

# ANEXSYS

Anexsys, Ltd. provides expert consulting, specialized solution development and outsourced services to law firms, corporations and the public sector. With services that range from ediscovery and digital forensics to legal reprographics, Anexsys relies on advanced document processing technologies to ensure its software solutions meet customer expectations for both quality and speed.

## THE CHALLENGE

### Enabling batch file conversion and printing

DocumentFolio is the flagship document presentation and processing suite developed by Anexsys to support legal professionals with a range of tools that bring efficiency and accuracy to their document bundling and document conversion processes. To expand this product's functionality, Anexsys needed to further enhance its ability to batch-process, convert and print files.

To accomplish this, they needed a technology that could accurately render a multitude of file formats into printable PDF formats, while supporting DocumentFolio's other features like Excel print optimization, attachment detection, and custom branding with watermarks, headers and footers.

### Enabling accurate redaction

Anexsys also wanted to expand its Relativity Apps review tool kit (RTK) suite with enhanced redaction capabilities to support the emerging responsibilities of customers under new privacy and security regulations. To enable intelligent automatic redaction, they needed a software solution that could accurately provide rendered coordinates of the words to be redacted on the page, regardless of the source file format as well as supporting optical character recognition (OCR) for non-searchable documents.

## THE SOLUTION

### Document Filters fits the bill

With Document Filters, Hyland's content inspection, extraction, conversion and manipulation SDK, Anexsys was able to address both requirements with a single SDK. With out-of-the-box support for over 550 file formats, Document Filters provided the versatility Anexsys was looking for in order to support the file processing needs of their customers.

The Document Filters layout engine provided exact, pixel-by-pixel coordinates of text, images and objects, enabling accurate rendering, file conversion and output. Leveraging the SDK's industry-leading file inspection and native OCR capabilities, Anexsys was also able to supply accurate file information to the redaction engine.

Since Document Filters runs natively on 27 platforms and provides flexible APIs that give developers the choice of languages, deploying Document Filters at Anexsys was simple and quick. Additionally, because they were able to use a single SDK to solve multiple needs, Anexsys was able to simplify licensing and future management requirements for this software.
